

Listing and Amendments to the Claims

This listing of claims will replace all prior versions and listings of claims in the Application.

1. (Currently amended) Method for detecting the orientation of images in a set of captured images representing a similar scene, ~~each image~~ all the images in said set of captured images containing at least one [a] similar object, wherein the method comprises the steps of:

choosing a reference image from the set of captured images, ~~which~~ the reference image having an orientation that is known *a priori*; and

detecting orientation of at least one other image of said set of captured images representing [a] the similar scene as a function of the orientation of said reference image.

2. (Previously presented) Method according to claim 1, comprising a step of calculating a visual distance between the reference image and the at least one other image.

3. (Currently amended) Method according to claim 2, comprising a step of calculating the visual distance between the at least one other image and the reference image for different orientations of the reference image, wherein the different orientations include the at least one other image and the reference image ~~are being~~ provided in a first orientation, ~~the at least one other image and the reference image having undergone a rotation of 90 degrees, 180 degrees, or and 270 degrees~~ with respect to the first orientation.

4. (Previously presented) Method according to claim 3, comprising a step of determining a subimage in the reference image and a subimage in the at least one other image, the calculation of the visual distance between the at least one other image and the reference image being performed on the respective subimages.

5. (Currently amended) Method according to claim 4, wherein said subimages have the same approximate size.

6. (Previously presented) Method according to claim 4, wherein said subimages are centered with respect to the images in which they are positioned.
7. (Previously presented) Method according to claim 4, wherein said subimages are positioned in such a way that the visual distance between said subimages are minimal.
8. (Previously presented) Method according to claim 1 comprising a step of selecting the reference image as a function of the distance between the reference image and a target image.
9. (Canceled)
10. (new) Method according to claim 4, wherein said subimages have same width to height ratio.
